

EXTREME DEEP CLEANS

cannon

hygiene solutions for washroom - technology - linen

It's not a pleasant or hygienic look. Brown rust and green copper streaks on the surfaces of urinals, toilet bowls and handbasins. It's the unsightly result of plumbing corrosion.

Although daily cleaning with a disinfectant/cleaning solution will sanitise and remove dirt and grease from surfaces, it won't remove that surface build up. An extreme Deep Clean by our specialised personnel involves a very specific cleaning process using acid cleaning solutions which requires expertise and extreme care during the cleaning process.

The process goes deep into the effluent system, helping to reduce unpleasant odours and assisting the freeflow of toilet wastes.

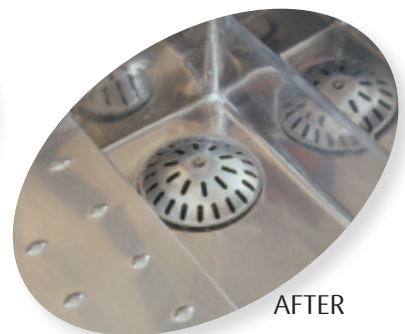

So why extreme Deep Clean? The fact is, not only is that build up a bad look, it's also a very real health risk. In certain areas it creates the perfect trap for harmful bacteria which will multiply and be released into the air. In urinals, the build up provides a medium for uric salts to accumulate.

Extreme Deep Clean is the ultimate process to ensure your washroom is maintained to the very highest level of hygiene.

An extreme Deep Clean actually removes all the build up as well as sanitising the whole area. A Cannon Hygiene consultant will assess the condition of your washroom facilities and recommend the right extreme Deep Clean programme. We'll carry out an initial extreme Deep Clean and follow it up with a maintenance service at intervals appropriate to your needs. And the best news is, it compliments your regular washroom cleaning procedures.
